                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of a single chain Fv (scFv) derivative of antibody 193/K2, comprising the heavy (vH) and light (VL) chain variable regions of 193/K2 joined by an artificial, flexible linker peptide. The scFv was obtained by PCR amplification of cDMAs for 193/K2 vH and VL regions and cloning in vector pDAP2. 193/K2 is can example of anti-human Factor IX (FIX)/activated Factor IX (FIX) antibodies of the invention. Anti-FIX/FIX and their derivatives, concluding scFv and CDR3 fragments, have Factor VIIIa (FVIIIa) cofactor activity or FIXa activating activity. Administration leads to an increase in the proceagulant activity. Administration leads to an increase in the proceagulant activity of FIXa, even in the presence of FVIII or FVIIIa, and in the case of FVIII or FVIII or FVIII and the case of FVIII or FVIII and the the case of FVIII or FVIII and the case of FVIII or FVIII and derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The effector protein is an enzyme, toxin, receptor, binding site, growth factor, cytokine or antimetabolite. The sequence capable of sequestering an ion is calmodulin or metallothionein. The sequence capable of binding to solid support is streptavidin or a protein A fragment. The protein may be used for, eg specific binding assays, affinity purificn., biocatalysts, drug targetting, imaging and immunological treatment of oncogenic etc. diseases. The protein offers fewer cleavage sites to circulating proteolytic enzymes and have improved stability. They reach target organs rapidly and are cleared quickly from the body. They also have reduced

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         biosynthetic protein. The protein also comprises an effector molecule with biological activity (eg an enzyme, receptor binding site, growth factor, lymphokine, cytokine or antimetabolite), an amino acid sequence capable of sequestering an ion (eg calmodulin or metallothionein), or an amino acid sequence capable of selective binding to a solid support (eg streptavidin or a fragment of protein A). The protein can be used for specific binding assays, affinity purificn, biocatalysts, drug targetting imaging and immunological treatment of oncogenic and infectious diseases. It offers fewer cleavage sites to circulating proteolytic enzymes, and improved stability. It reaches target tissues rapidly and is quickly cleared from the body. It also has reduced immunogenicity and its design facilitates binding to other moieties in drug targetting and imaging

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The light chain variable domain comprises complementarity determining regions of glp4 and framework regions from multine antidigoxin monoclonal 26-10. The domain forms part of a single chain multi-functional biosynthetic protein. The protein also comprises an effector molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page ?; 15pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant multifunctional protein - having antibody binding sequence for biological activity, ion sequestering or binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 1988-353928/49

                                                                                                                                                                                                                                             The invention relates to a biosynthetic antibody binding site that comprises disulfide bonded heavy, light variable region (HVR, LVR) defining single, complete antigen (Ag1) binding site. HVR, LVR have polypeptide domain having sets of complementarity determining regions (CDR) and framework (FR) amino acid sequences homologous to first and second immunoglobulin respectively. The biosynthetic antibody binding sites are useful in specific binding assays, affinity purification, biocatalysis, drug targeting, imaging immunological treatment of various oncogenic and infectious diseases. The present sequence represents the light chain variable domain of a chimeric Fv (BABS) comprising the CDRs of murine monoclonal glp-4 (anti-lysozyme) and FRS of murine monoclonal
                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Fig 4D; 26pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              anti-oxazalone antibody. NQ11, has been described by E. Gheradi, R. Pannell, and C. Milstein, (J. Immunol. Method 126 61-68). A plasmid contg. the VH and VL genes of NQ11 was converted to the scrv form by inserting the BstEII/SacI fragment of scFvD1.3 myc (nucleotides 432-499 of AAQ21096) between the VH and VL genes to generate pscFvNQ11 (protein sequence shown here). This scFv was cloned into PdTPs/Xh (see AAQ21095) to generate pAb NQ11. The specific bindin of pAb NQ11 was confirmed by ELISA.

                                                                                                                                                                                                                     멼
                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a humanised form of the antibody 340 (a C mouse monoclonal antibody which binds to epidermal growth factor (EGF) receptor and inhibits binding of EGF), obtainable from the cell line composited with the ECACC under accession number 97021428. The humanised CC manufacture of a medicament for treatment or prophylaxis of cancer. The invention is useful for treatment or prophylaxis of cancer after composition and the composite of cancer after composition and the composition of the action of the recurrence of cancer after composition cancers or also for preventing the recurrence of cancer after composition in the invention is also useful for enhancing a protective immune response against cancer by optimised immunisation composition of the antibody 340 has reduced immunogenicity but shows similar binding to cells expressing EGF conceptor, as the original murine antibody and has increased ability to inhibit the growth of EGF receptor expressing cells. The invention is cused as cell growth and apoptosis inhibitor. The present sequence is mouse monoclonal antibody alpha 340 light chain variable (VK) region.
                                                                                                                                                                                                                                                                                                                                                  Query Match

The present sequence is that of the murine anti-idiotype monoclonal cantibody (MAb) 1A7 variable light chain. MAb 1A7 was raised against the anti-ganglioside 2 (GD2) MAb 1432a, which binds an unique Ceptiope of GD2. As the glycosphingolipid GD2 is expressed at high Consisty by human neuroectodermal tumours, e.g. malignant melanoma, concerned the lung, MAb 1A7, or its cDNA, can be used to reduce the corporate success. They can also be used to reduce the crisk of recurrence of a clinically detectable tumour, and detect an cuti-GD2 Ab bound to a tumour cell.

Consist GD2, which comprises anti-GD2 Ab (humoral response) and cuti-GD2 which comprises anti-GD2 Ab (humoral response) and cuti-GD2 in a sample or measure the level of cellular anti-IA7 or anti-GD2 in a sample or measure the level of cellular anti-IA7 or anti-GD2 in a sample or measure the level of cellular anti-IA7 or anti-GD2 in a sample or measure the level of cellular anti-IA7 or
                     The cDNA can be used in expression systems for 1A7 prodm., and in the prepm. of probes and primers to respectively assay for 1A7 cDNA, and amplify desired polynucleotides for use in gene therapy (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                         Claim 8;

                                                                                                                                                                                                                                                                                                                                                                The invention provides a method of treating of psoriasis by administering an antigen which has similar immunogenic properties to an antigen expressed on cells of psoriatic tissue so that an immunological response is elicited in the individual. The antigen stimulates the generation of anti-idiotype antibodies that neutralize the aberrant immune response causing the psoriasis. The method is used to treat psoriasis, especially chronic plaque, gluttate, pustular, plaque-type psoriasis or psoriatic arthritis. The compositions allow the individual's own immune system to act against psoriatic tissue. The present sequence represents the light chain variable region of monoclonal antibody 1A7.

                                                                       밁
                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                            Composition is present between the time train of more around to activated vitronectin receptor alpha-v beta-3. WOW-1 Fab was created by replacing the 19 amino acid heavy chain complementarity determining region 3 (CDR3) of PACI Fab with the 50 amino acid alpha-v integrin-binding domain from adenovirus type 2 penton base protein by splice-overlap PCR (see AAA27850-53). PACI is a known monoclonal cantibody which immunoreacts with platelet glycoprotein receptor. The modified PACI antibody (designated WOW-1) has been expressed as WOW-1 Fab is used in a claimed method for detecting the presence of activated vitronectin receptor alpha-v beta-3 in a tissue, and in a claimed method for detecting the presence of claimed method for delivery of an agent in a therapeutic composition to such a tissue ex vivo or in vivo, the tissue being selected from neovascular cells, smooth muscle endothelial cells, arterial cells, composition is preferably a biologically active compound, especially a gene, antisense nucleic acid or catalytic nucleic acid (claimed).
                                                                                                                                                                                                                   Query Match

The invention provides a monoclonal antibody (MAD) dusignated 1A7, which elicits an anti-GD2 (tumor-associated antigen) immunological response in humans. MAD 1A7 has defined light and heavy Chain variable region sequences. The MAD 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 -associated disease, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the light chain variable region of MAD 1A7.

Monoclonal antibody 1A7 which elicits an anti-GD2 immunological response, useful for the development of products for the detection treatment of cancers -

This polypeptide is the variable light chain region of monoclonal anti-idiotype antibody 1A7. The polypeptide has three CDRs (complementarity determining regions) and four frame work regions. When administered to an individual the 1A7 antibody induces an immune-response against ganglioside GD2. The heavy chain variable region of the 1A7 antibody (AAY28469) is also capable of eliciting an anti GD2 response in mammals. Both the heavy and light chain variable regions of the 1A7 antibody produce anti-GD2 T cell and antibody responses. The peptides and antibody produce anti-GD2 T cell and antibody responses. The peptides and antibody smay be useful for the modulation of ganglioside GD2, and particularly for the treatment of GD2-associated tumours e.g. melanoma neuroblastoma, glioma, soft tissue sarcoma, and small cell carcinoma

                                                                                                                                                                                                                                                                                                                              This polypeptide is the product of PCR amplification and the joining of PCR products, creating Vh-(Lk)-Vl of antibody 1A7. Both the heavy and light chain variable regions of the 1A7 antibody produce anti-CD2 T cell and antibody responses. The peptides and antibodies may be useful for the modulation of ganglioside GD2, and particularly for the treatment of GD2-associated tumours e.g. melanoma, neuroblastoma, glioma, soft tissue sarcoma, and small cell carcinoma (including small cell lung cancer).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21-NOV-1996;

                                                                                            Ś
                                                                                                                                                                                                                                   CC The present invention describes the use of a polypeptide (I) in the CC manufacture of a medicament for stimulating a cytotoxic T cell response, CC where (I) comprises a first portion comprising the part of human PC that CC binds to CD64 and a second portion comprising one or more heterologous CC T cell response in a patient such as a mammal, preferably human, by CC administering (I) to the patient. (I) has cytostatic activity and can be used in vaccine production. (I) and the nucleic acid encoding (I) are CC useful in the manufacture of a medicament for stimulating cytotoxic T CC cell response. The medicament is useful for preventing and/or treating CC cancer, e.g. colorectal, lung, breast, gastric or ovarian cancer. The CC medicament stimulates cytotoxic and helper T cell responses. The colorectal as vaccines to stimulate helper and cytotoxic T CC cell responses. The polypeptides and nucleic acids are useful in CC optimising immunisation schedules for enhancing a protective immune response against cancer. The present sequence represents an Fv region CC con example from the mresent inventor

MAb 1A7 has defined light and heavy chain variable region sequences. The MAb 1A7 and polypeptides can be used for eliciting an anti-GD2 immune response. The polypeptides can also be used for detecting or purifying anti-GD2 antibody. The products can be used for treating GD2 -associated diseases, e.g. melanoma, neuroblastoma, glioma, soft tissue carcinoma, and small cell carcinoma. They can be used for palliating the disease or for reducing the risk of recurrence. The present sequence represents the light chain variable region consensus sequence.
                                                                                Mouse immunoglobulin E light chain.

                                                                                                                                                                                                              The present invention describes a transgenic, non-human animal with its genome altered to constitutively express a molecule having a constant region which can bind an IgE receptor on mast cells in the animals, the molecule having an immunoglobalin structure and being further capable of specifically binding a predetermined antigen. The transgenic animal is useful as a model for evaluating the activity and the ability of substances i.e. with antiallergic activity, to affect any allergic reaction caused in the animal by the administration of the antigen to the animal, and applying the substance to be evaluated. The present sequence is the mouse immunoglobulin E (IgE) light chain, given in the present invention.

Publication No. US20030099655A1
GENERAL INFORMATION:
APPLICANT: Watkins, Jeffry D.
APPLICANT: Huse, William D.
APPLICANT: Tang, Ying
TITLE OF INVENTION: Humanized Collagen Antibodies and
TITLE OF INVENTION: Related Methods
FILE REFERENCE: P-IX 4976
CURRENT APPLICATION NUMBER: US/09/995,529
CURRENT FILING DATE: 2001-11-26
NUMBER OF SEQ ID NOS: 358
SOPTWARE: FastSEQ for Windows Version 4.0
EENGTH: 112
TYPE: PAT
ORGANISM: Mus musculus

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score
